deep learning

Keras 101

Hugo Estrada S.

Hugo Estrada S.

Cloud Engineer & Data Consultant

Deep Learning

Practical Examples

- Identifying objects and images.
- Creation caption for thos images.
- Determining the sentiment of text, even with it has a layer of sarcasm.
 - Create the logic of self-driving vehicles.

Keras

What on Earth is that?

Is a highlevel neural network API.

is written in Python and capable of running onTop of TensorFlow, Microsoft Cognitive Toolkit, CNTK or Theano.

Threre's also an R version of Keras.

NLP is all about getting the computer what "nature" actually signifies.

SPAM Filter, Auto-Complete, Auto-Correct, Sentiment analysis, Topic modeling, Text classification, Sentence segmentation or part-of-speech tagging.

Keras Environment

Keras Environment

Program

Keras (NN API)

Backend (TF,
CNTK, Theano)

Neural Networks

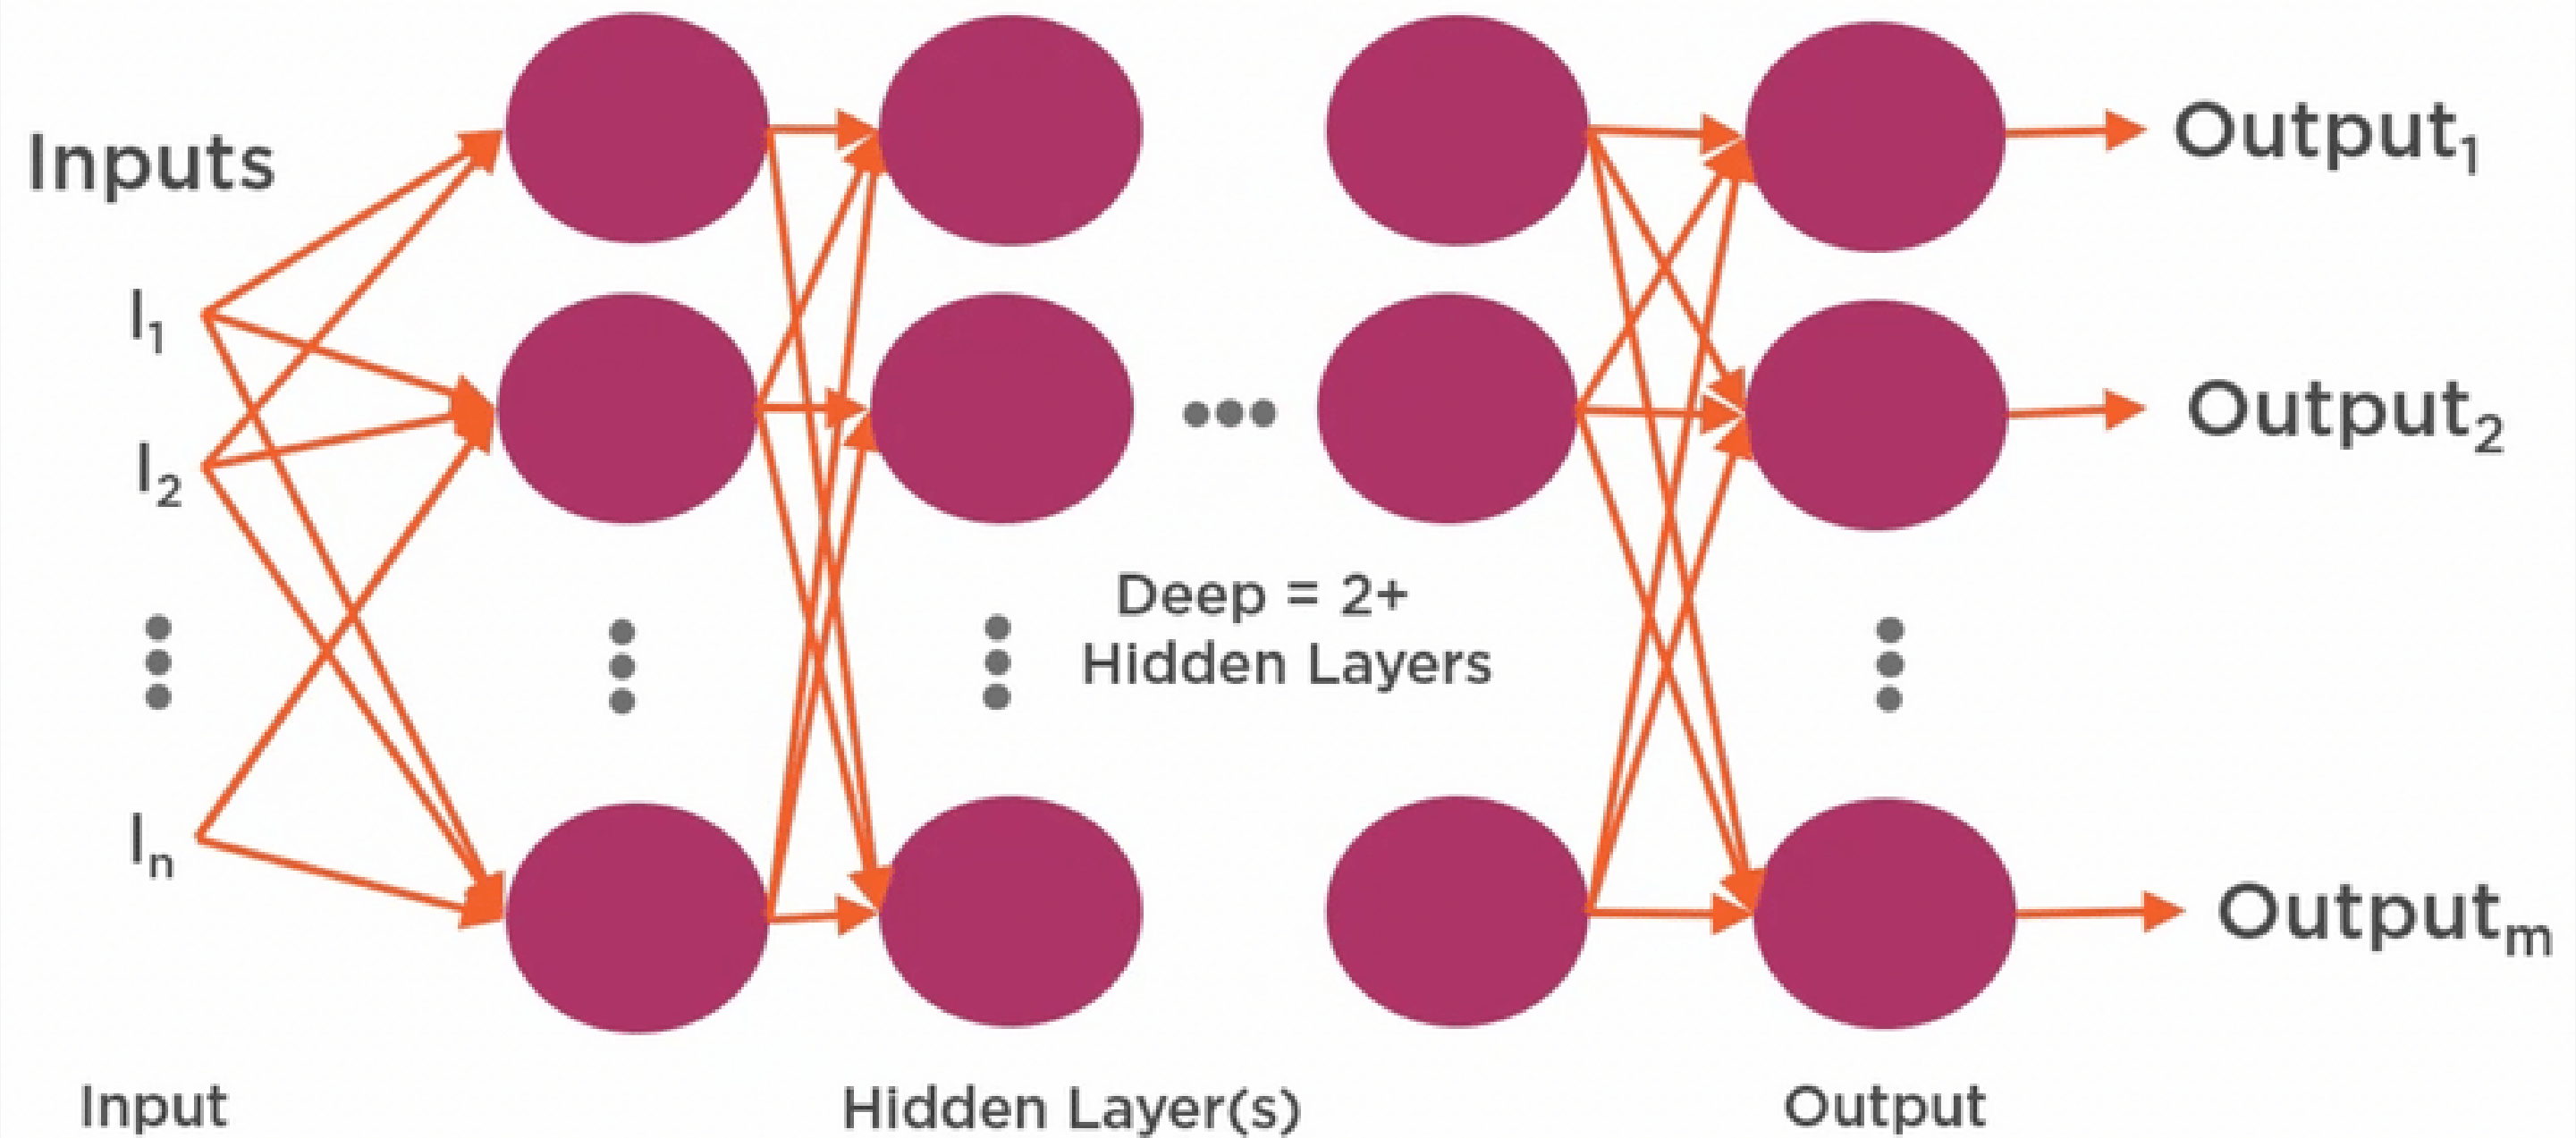

Neural Network Layers

Neural Network Layers

Deep Neural Network Layers

Neuron

Inputs

I_1

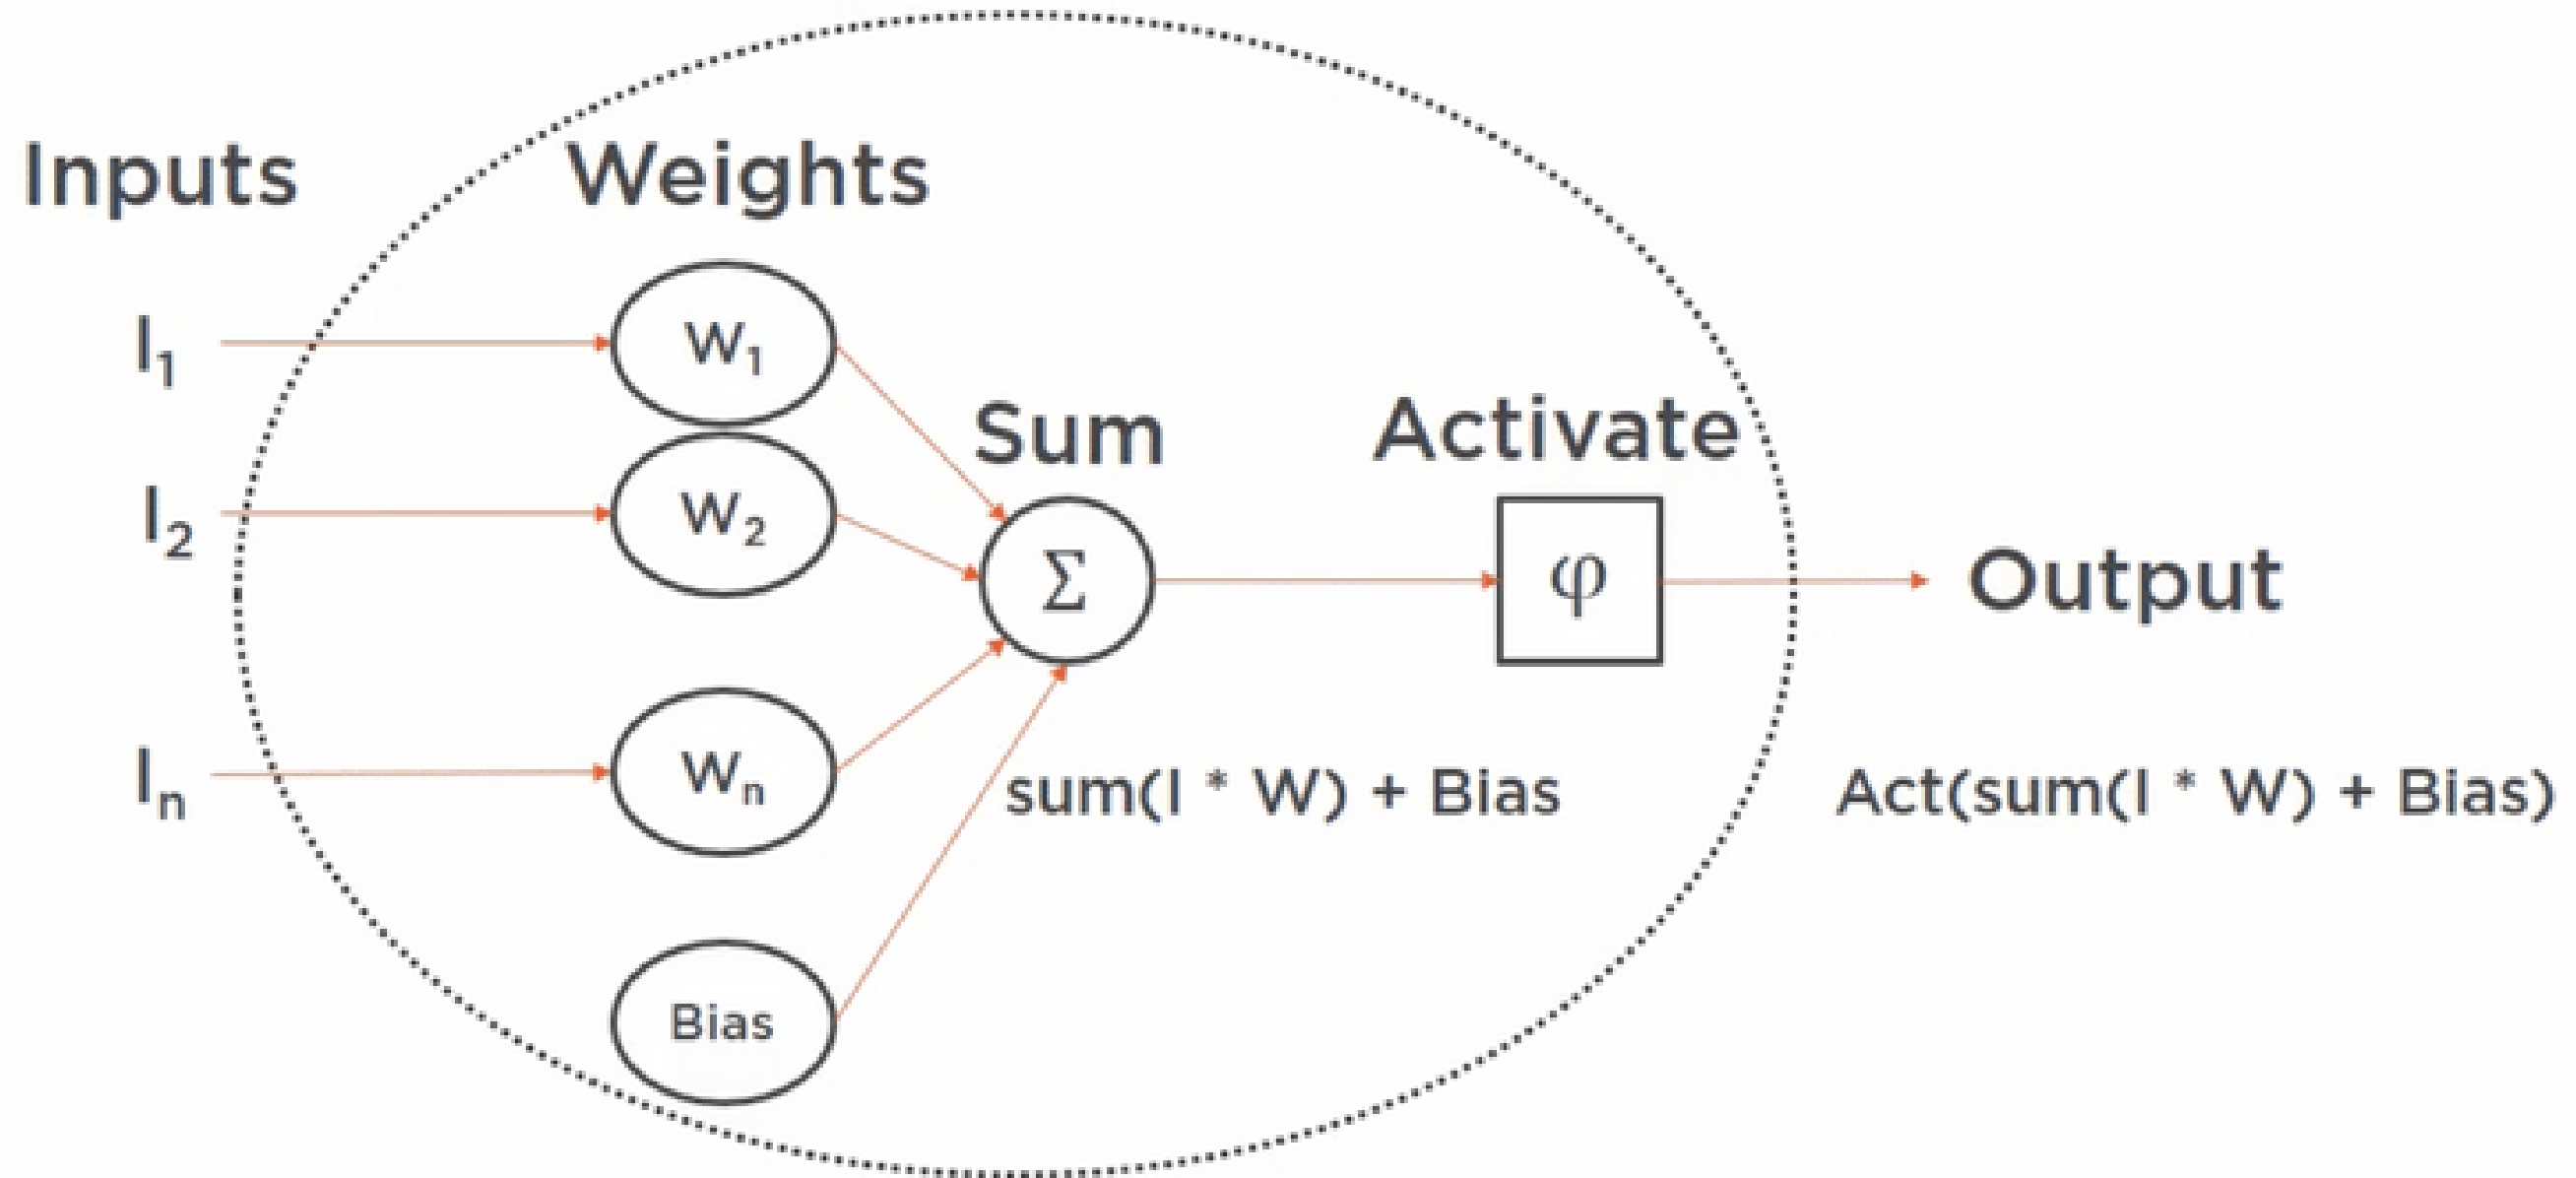

I_2

I_n

Output

Neuron Training

Trained Neural Network

Neural Networks in a Nutshell

Input, Hidden, Output layers
Trained to minimize error
Training adjusts weights and
biases
2+ Hidden layers -> Deep
Neural Network

Creating your first Neural Network

You first need to install Keras

Install TensorFlow

Keras in TF

Import tf.keras

No need to install
standalone Keras

Close integration
with TF

Tied to TF

Standalone Installation

**Keras as a
separate package**

Download and install Keras

Install Keras on
system/environment

Keras handles interface with
backend

Supports TensorFlow,
Theano, CNTK

Our First Neural Network with Keras

**Best Line
to Divide
the Data**

Thanks !
